Your Personalized Optimization Report

Here's what we learned from visitors on **https://example.com/landing**. We looked at how people scroll, click, and react—then asked Claude (our assistant) to suggest a rewrite too.

Scroll Behavior

Most users stop scrolling after 62% on this page (last 30 days).

What it tells us: Users are disengaging around the 60% scroll mark.

Try this: Move key CTAs above this point to improve conversions.

CTA Engagement

Here's what people clicked on most:

- **Sign Up Now** – 45 clicks
- **Learn More** – 28 clicks
- **Get Started** – 22 clicks

Confusion Signals

Behavioral signals suggest users are confused in multiple areas of the page.

We noticed:

- repeated clicks
- quick page exits
- long idle times

Try this: Refine UX in problem areas using microcopy or progressive disclosure.

## Rage Clicks

Detected 15 rage clicks near the pricing section.

Suggestion: Reassess button responsiveness and surrounding content clarity.

⚡ Page Speed

Load time is 3.1s on average.

Suggestion: Compress media, defer non-critical scripts, and implement lazy loading.

Claude Rewrite (Text-Based)

Claude reviewed your current hero section and offered a more actionable rewrite. Here's what it came up with:

> Welcome to Signals — Optimize your site based on how real users behave. Start improving today.

Why this rewrite? Claude suggests revising the hero section to emphasize clarity and action.

We'll keep tracking. Let us know if you want deeper insights next time!
